Example Problems and Solutions

Example 1: Two-Variable Word Problem

Problem:

Gina Wilson 2012 algebra problem: A store sells pencils and erasers. The total cost for 3 pencils and 2 erasers is \$5.50. If each pencil costs \$0.50, what is the cost of each eraser?

Solution:

Step 1: Define variables:

Let x = cost of one eraser.

Step 2: Write the equation based on the problem:

Cost for 3 pencils = $3 \times \$0.50 = \1.50

Total cost: $1.50 + 2x = 5.50$

Step 3: Set up the equation:

$$3(0.50) + 2x = 5.50$$

$$0.50(3) + 2x = 5.50$$

Step 4: Simplify and solve for x:

$$1.50 + 2x = 5.50$$

$$2x = 5.50 - 1.50$$

$$2x = 4.00$$

$$x = 4.00 / 2$$

$$x = 2.00$$

Answer: Each eraser costs \$2.00.

Example 2: System of Equations Word Problem

Problem:

Gina Wilson 2012 algebra problem: A train travels from city A to city B at 60 mph. The same train travels from city B to city A at 40 mph. If the distance between the two cities is 180 miles, how long does each trip take?

Solution:

Step 1: Define variables:

Let t = time (in hours) for the trip from city A to B.

Step 2: Set up equations:

Time from A to B: t

$$\text{Distance} = \text{speed} \times \text{time} = 60 \times t$$

Similarly, for B to A, the time is $(180 / 40) = 4.5$ hours, but since the problem asks for the time based on the variable, we can verify the total distance:

$$\text{Total distance: } 60t + 40t = 180$$

Step 3: Write the equation:

$$60t + 40t = 180$$

Step 4: Simplify and solve:

$$100t = 180$$

$$t = 180 / 100$$

$$t = 1.8 \text{ hours}$$

Step 5: Find time in hours for each trip:

- From city A to B: 1.8 hours
- From city B to A: $180 / 40 = 4.5$ hours

Answer: The trip from city A to B takes approximately 1.8 hours, and the return trip takes 4.5 hours.

Educational Value:

These problems promote understanding of linear relationships, substitution, and equality solving, while grounding algebra in relatable contexts.

Systems of Equations

Example:

A local gym offers two membership plans: a monthly plan costing \$30 per month, and a yearly plan costing \$300 upfront. If a customer chooses to pay for 6 months and spends the same amount as the monthly plan, what is the number of months needed to break even with the yearly plan?

Analysis:

- Set up equations: $(30 \times 6 = 300)$ (monthly plan total cost).
- Students analyze when paying monthly becomes cost-effective compared to a lump-sum annual payment.

Educational Value:

These problems develop skills in solving systems of equations, comparing options, and understanding cost-benefit scenarios.

Quadratic Word Problems

Example:

A ball is thrown upward with an initial velocity of 20 meters per second. Its height $h(t)$ in meters after t seconds is modeled by $h(t) = -4.9t^2 + 20t$. When will the ball reach a height of 15 meters?

Analysis:
